**Abstract.** This is the appendix for all the proofs in the paper "Attack-defense semantics of argumentation".

## A. Proofs

**Theorem 1.** If D is a stable attack-defense extension, then it is complete and preferred, but not necessarily vice versa.

*Proof.* Since for all  $z_y^x \in T \setminus D$ ,  $y \in \mathbf{defendee}(D)$ ,  $D \cup \{z_y^x\}$  is not admissible. So, D is complete. Assume that D is not maximal. Let  $D' \subset D$  be a preferred attack-defense extension. For each  $z_y^x \in D' \setminus D$ ,  $D \cup \{z_y^x\}$  is not admissible. So, D' is not admissible. Contradiction. For the counter example, consider  $T = \{a_a^a\}$ . The emptyset is both a preferred attack-defense extension and a complete attack-defense extension, but not a stable attack-defense extension.

**Theorem 2.** Let D be a set of attack-defenses. If  $defendee(D) \cap attacker(D) = \emptyset$ , then D is a complete attack-defense extension iff  $D = F_T(D)$ . The grounded attack-defense extension is the least complete attack-defense extension of F (w.r.t. set inclusion).

*Proof.* Since **defendee**(D)  $\cap$  **attacker**(D) =  $\emptyset$  and D =  $F_T(D)$ , D is admissible. Since no attack-defense in  $T \setminus D$  is successful w.r.t. D, D is complete. Since  $F_T$  is monotonic, there is a unique least fixed point that is the least complete attack-defense extension of F.  $\square$ 

**Theorem 3.** Let  $T \subseteq \mathcal{D}^U$  be an attack-defense framework. For all  $D \in \Sigma(T)$ ,  $x, u \in \mathbf{argument}(T)$ , if  $z_y^x$ ,  $w_y^u \in D$ ,  $z_{y'}^w \in T$ , then  $z_{y'}^w \in D$ .

*Proof.* We need to verify this property under complete attack-defense semantics. Since  $w_v^u \in D$ ,  $w \in \mathbf{defendee}(D)$ . Since  $z_y^x \in D$ , for each  $y' \neq y$  that attacks z,  $\exists z_{v'}^{x'} \in D$ . Thus,  $z_{v'}^{x'}$  is successful w.r.t. D. Since D is a complete attack-defense extension,  $z_{v'}^{y'} \in D$ .

**Theorem 4.** For all  $D \in \Sigma(T)$ , if  $z_y^x \in D$  and  $x \neq T$  then there exists  $x_{y'}^u \in T$  s.t.  $x_{y'}^u \in D$ .

*Proof.* According to Definition 3, since  $z_y^x \in D$ , it holds that defender  $x \in \mathbf{defendee}(D)$ . So, there exist  $u, y' \in \mathbf{argument}(T)$  such that  $x_{y'}^u \in D$ .

<sup>&</sup>lt;sup>1</sup>Corresponding Author: Beishui Liao.

The third property is about the incompleteness of an attack-defense framework.

**Theorem 5.** For all  $z_{\nu}^{x}, v_{\nu}^{u} \in T$ , it is not necessary that  $v_{\nu}^{x} \in T$ .

*Proof.* By definition, this property obviously holds.

**Theorem 7.** Defenses  $z_y^v, z_z^x \in T$  are unsatisfiable. Furthermore, if  $z_y^v \in T$ , then  $u_v^y$  is unsatisfiable under semantics  $\Sigma \in \{CO, PR, GR, ST\}$ .

*Proof.* First,  $z_y^y$  means that y self-attacks and it attacks z. If  $z_y^y$  is in an admissible set of attack-defenses, then y is a defendee. According to Definition 4, **defendee** $(D) \cap$  **attacker** $(D) \neq \emptyset$ . Contradiction. Second, obviously,  $z_z^x$  is not satisfiable. Third, assume that  $u_y^y$  is in some attack-defense admissible set D. Then, according to Theorm 4, there exists  $y_w^x \in T$  such that  $y_w^x \in D$ . If w = y, then this contradicts **defendee** $(D) \cap$  **attacker** $(D) = \emptyset$ . Otherwise, according to the definition of complete attack-defense extension,  $z_y^y$  is also in D. This also contradicts **defendee** $(D) \cap$  **attacker** $(D) = \emptyset$ .

**Theorem 8.** If there exist  $x_z^y, y_x^z, z_y^x \in T$ , then  $x_z^y, y_x^z$  and  $z_y^x$  are unsatisfiable under semantics  $\Sigma \in \{CO, PR, GR, ST\}$ .

*Proof.* Assume that  $x_z^y$  is in some admissible set  $D \subseteq T$ . Then,  $y_x^z$  is also in D. As a result, **defendee** $(D) \cap \mathbf{attacker}(D) \supseteq \{x\}$ , contradicting **defendee** $(D) \cap \mathbf{attacker}(D) = \emptyset$ .  $\square$ 

**Theorem 9.** For any attack-defense framework T, and for  $\Sigma \in \{CO, PR, GR\}$ ,  $\Sigma(T) = \Sigma(T^-)$ .

*Proof.* Under complete attack-defense semantics, let  $D \in CO(T)$ . Since for all  $z_y^x \in u(T)$ ,  $z_y^x$  is unsatisfiable,  $z_y^x \notin D$ . According to Definitions 4 and 5, D is a complete attack-defense extension of  $T^-$ . On the other hand, let  $D \in CO(T^-)$ . Since any attack-defense in u(T) is unsatisfiable, adding it to  $T^-$  does not affect the evaluation of other attack-defenses. Therefore, D is a complete attack-defense extension of T. Similarly, under preferred and grounded attack-defense semantics, this property also holds.

**Theorem 10.** For any attack-defense frameworks T and T', for any  $B \subseteq \mathbf{argument}(T) \cap \mathbf{argument}(T')$ , if  $T \equiv_d^{\Sigma} T'$  then  $T \equiv_{r,B}^{\Sigma} T'$ , but not vice versa.

*Proof.* Since  $T \equiv_d^{\Sigma} T'$ ,  $\Sigma(T) = \Sigma(T')$ . For all  $D \in \Sigma(T)$ , for all  $z \in B$ ,  $root_{\Sigma}(z,T) = root_{\Sigma}(z,T')$ . As a result,  $T \equiv_{r,B}^{\Sigma} T'$ .

For the converse direction, consider  $T_3$  and  $T_3'$  in Examples 3 and 4. Under preferred attack-defense semantics,  $PR(T_3) \neq PR(T_3')$ , i.e., it is not the case that  $T_3 \equiv_d^{PR} T_3'$ . Meanwhile, let  $B = \{a,b\}$ . As described in Example 4, we have  $T_3 \equiv_{RR}^{PR} T_3'$ .

**Theorem 11.** Let  $d(\mathscr{F})$  be the attack-defense framework of an AF  $\mathscr{F} = (\mathscr{A}, \to)$ . For all  $z_{v}^{x}, v_{v}^{u} \in d(\mathscr{F})$ , it holds that  $v_{v}^{x} \in d(\mathscr{F})$ .

*Proof.* Since  $z_y^x, v_y^u \in d(\mathscr{F})$ , it holds that  $x \to y, y \to z, u \to y$  and  $y \to v$ . Given that  $x \to y$  and  $y \to v$ , we have  $v_y^x \in d(\mathscr{F})$ .

**Theorem 12.** For all  $D \in \Sigma(d(\mathscr{F}))$ , **defendee** $(D) \in \sigma(\mathscr{F})$ , where  $\Sigma \in \{CO, PR, GR, ST\}$  and  $\sigma \in \{co, pr, gr, st\}$ .

*Proof.* Let *D* be a complete attack-defense extension of  $d(\mathscr{F})$ . According to Definition 4, **defendee**(*D*)  $\cap$  **attacker**(*D*) =  $\emptyset$ . Hence, **defendee**(*D*) is conflict-free. According to Definition 3, for all  $z \in \mathbf{defendee}(D)$ , z is an initial argument, or every attacker of z is attacked by an argument in **defendee**(*D*). So, **defendee**(*D*) is an admissible set of arguments. According to Definition 5, each successful attack-defense w.r.t. *D* is in *D*. So, each argument that is defended by **defendee**(*D*) is in **defendee**(*D*). Therefore, **defendee**(*D*) is a complete extension of  $\mathscr{F}$ . When *D* is a preferred attack-defense extension, it is easy to see that **defendee**(*D*) is a maximal complete extension (w.r.t. set inclusion) and therefore is a preferred extension of  $\mathscr{F}$ . Similarly, this properpy holds under grounded attack-defense semantics. Finally, when *D* is a stable attack-defense extension, for all  $z_y^x \in d(\mathscr{F}) \setminus D$ ,  $y \in \mathbf{defendee}(D)$ . This means that for each argument  $z \in \mathscr{A} \setminus \mathbf{defendee}(D)$ , z is attacked by an argument y in **defendee**(D). Hence, **defendee**(D) is a stable extension of  $\mathscr{F}$ .

**Theorem 13.** For all  $E \in \sigma(\mathscr{F})$ , let  $def(E) = \{z_y^x \mid z_y^x \in d(\mathscr{F}) : x, z \in E\} \cup \{z_{\perp}^{\top} \mid z_{\perp}^{\top} \in d(\mathscr{F}) : z \in E\}$ . Then,  $def(E) \in \Sigma(d(\mathscr{F}))$ .

*Proof.* Let E be a complete extension of  $\mathscr{F}$ . For each  $z_y^x \in \text{def}(E)$ , since  $x, z \in E$  and E is admissible,  $z_y^x$  is successful w.r.t. def(E). **defendee** $(\text{def}(E)) \cap \text{attacker}(\text{def}(E)) = \emptyset$ . Otherwise, if there is an attacker in def(E) that is a defendee, then E = defendee(def(E)) is not conflict-free, contradicting the fact that E is conflict-free. As a result, def(E) is admissible. Assume that def(E) is not complete. Then, there exists  $z_y^x \in \text{de}(\mathscr{F})$ , such that  $z_y^x$  is successful w.r.t. def(E), and  $z_y^x \notin \text{def}(E)$ . Since  $z_y^x \notin \text{def}(E)$ ,  $x \notin E$  or  $z \notin E$ . If  $x \notin E$ , then  $x \notin \text{defendee}(\text{def}(E))$  and therefore  $z_y^x$  is not successful w.r.t. def(E). Contradiction. Alternatively, if  $z \notin E$ , then since E is a complete extension of  $\mathscr{F}$ , z is not defended by E. Then, there exists  $y' \neq y$ , such that y' attacks z and y' is not attacked by any argument in E. It turns out that  $z_y^x$  is not successful w.r.t. def(E). Contradiction. Hence, def(E) is a complete attack-defense extension of  $\text{d}(\mathscr{F})$ .

When E is a preferred extension of  $\mathscr{F}$ , E is maximal and therefore def(E) is maximal (w.r.t. set inclusion). Hence, def(E) is a preferred attack-defense extension of  $d(\mathscr{F})$ . Similarly, this properpy holds under grounded semantics.

Finally, when E is a stable extension of  $\mathscr{F}$ , for all  $z \in \mathscr{A} \setminus E$ , z is attacked by an argument in E. This means that for each defense  $z_y^x \in d(\mathscr{F}) \setminus def(E)$ ,  $y \in defendee(def(E))$ . Therefore, def(E) is a stable attack-defense extension of  $d(\mathscr{F})$ .

**Theorem 14.** Let  $\mathscr{F}$  and  $\mathscr{G}$  be two AFs. If  $d(\mathscr{F}) \equiv_d^{\Sigma} d(\mathscr{G})$ , then  $\mathscr{F} \equiv^{\sigma} \mathscr{G}$ , where  $\Sigma \in \{CO, PR, GR, ST\}$ ,  $\sigma \in \{co, pr, gr, st\}$ .

*Proof.* If  $d(\mathscr{F}) \equiv_d^{\Sigma} d(\mathscr{G})$ , then  $\Sigma(d(\mathscr{F})) = \Sigma(d(\mathscr{G}))$ . According to Theorem 12,  $\sigma(\mathscr{F}) = \mathbf{defendee}(\Sigma(d(\mathscr{F}))) = \mathbf{defendee}(\Sigma(d(\mathscr{G}))) = \sigma(\mathscr{G})$ . Since  $\sigma(\mathscr{F}) = \sigma(\mathscr{G})$ ,  $\mathscr{F} \equiv^{\sigma} \mathscr{G}$ .

**Lemma 1.** It holds that  $CO(d(\mathscr{F})) = CO(d(\mathscr{F}^{ck}))$ .

*Proof.* Since for every attack-defense that is related to a self-attacking argument is unsatsifiable, it is clear that  $CO(d(\mathscr{F})) = CO(d(\mathscr{F}^{ck}))$ .

**Theorem 15.** Let  $\mathscr{F}$  and  $\mathscr{G}$  be two AFs. If  $\mathscr{F} \equiv_s^{co} \mathscr{G}$ , then  $d(\mathscr{F}) \equiv_d^{CO} d(\mathscr{G})$ .

*Proof.* Obvious.

**Theorem 16.** Let  $\mathscr{F} = (\mathscr{A}_1, \to_1)$  and  $\mathscr{H} = (\mathscr{A}_2, \to_2)$  be two AFs. If  $d(\mathscr{F}) \equiv_r^{\Sigma} d(\mathscr{H})$ , then  $\mathscr{F} \equiv^{\sigma} \mathscr{H}$ , where  $\Sigma \in \{\text{CO}, \text{PR}, \text{GR}, \text{ST}\}$  and  $\sigma \in \{\text{co}, \text{pr}, \text{gr}, \text{st}\}$ .

*Proof.* According to Definition 14, under complete semantics, the number of extensions of  $co(\mathscr{F})$  is equal to the number of  $root_{CO}(z, d(\mathscr{F}))$ , where  $z \in \mathscr{A}_1$ . Since  $root_{CO}(z, d(\mathscr{F})) = root_{CO}(z, d(\mathscr{H}))$ ,  $\mathscr{A}_1 = \mathscr{A}_2$ .

Let  $root_{CO}(z, d(\mathscr{F})) = root_{CO}(z, d(\mathscr{H})) = \{R_1, ..., R_n\}$ . Let  $co(\mathscr{F}) = \{E_1, ..., E_n\}$  be the set of extensions of  $\mathscr{F}$ , where  $n \ge 1$ .

For all  $\alpha \in \mathcal{A}_1$ , for all  $R_i$ , i = 1, ..., n, we have  $\alpha \in E_i$  iff  $R_i \neq \{\}$ , in that in terms of Definition 14, when  $R_i \neq \{\}$ , there is a reason to accept  $\alpha$ .

On the other hand, let  $co(\mathscr{H}) = \{S_1, \dots, S_n\}$  be the set of extensions of  $\mathscr{H}$ . For all  $\alpha \in \mathscr{A}_2 = \mathscr{A}_1$ , for all  $R_i$ ,  $i = 1, \dots, n$ , for the same reason, we have  $\alpha \in S_i$  iff  $R_i \neq \{\}$ . So, it holds that  $E_i = S_i$  for  $i = 1, \dots, n$ , and hence  $co(\mathscr{F}) = co(\mathscr{H})$ , i.e.,  $\mathscr{F} \equiv^{co} \mathscr{H}$ .

Simlarly, this property holds under preferred semantics and grounded semantics, respectively.

Finally, under stable semantics, if  $ST(d(\mathscr{F})) = ST(d(\mathscr{H})) = \emptyset$ , then  $st(\mathscr{F}) = st(\mathscr{H}) = \emptyset$ . Hence,  $\mathscr{F} \equiv^{st} \mathscr{H}$ . Otherwise,  $st(\mathscr{F}) = st(\mathscr{H}) \neq \emptyset$ . In this case, as verified under complete semantics, it holds that  $\mathscr{F} \equiv^{st} \mathscr{H}$ .
